CHAPTER 01 · DIRECTION OVER PROMPT

When Everything Can Be Made

WHAT BECOMES SCARCE WHEN MAKING BECOMES ABUNDANT?

GESSIKA OLIVIERI · LOLALAB · LOLALABSTUDIO.COM

THE WOMAN WHO EXISTS EVERYWHERE

She appears again.

A woman who never existed, photographed in a place that may not exist either. Her skin has no pores. The light wraps around her face with perfectly measured tenderness. The fabric falls at the exact point between luxury and ease. Behind her, a European city dissolves into impeccable depth of field.

Nothing is wrong.

That is precisely why something is deeply wrong.

The image knows every signal we have learned to associate with relevance. It knows the muted palette of an independent magazine, the expensive restraint of a fragrance campaign, the candid imperfection of a photograph that was never candid. It can reproduce the appearance of intimacy without having witnessed anything intimate. It can stage evidence of a life that was never lived.

Nothing in the image fails. The light is plausible. The skin is immaculate. The wardrobe signals taste. The composition knows exactly where to place the eye. Yet the elements do not seem answerable to the same intention. The light proposes intimacy; the posture performs advertising; the skin belongs to a beauty campaign; the setting gestures toward documentary realism. Each decision is convincing in isolation. Together, they produce emotional collage.

The image was not poorly executed. It was executed before there was a sufficiently specific reason for it to exist.

This distinction matters because the central problem of synthetic media is no longer whether an image can be made. Increasingly, it can. The harder question is why this image, in this world, for this audience, with this emotional temperature, deserves to survive among all the others.

THE OLD RESISTANCE

For most of visual history, intention had to pass through resistance.

A photograph required a body in a place, light arriving from somewhere, a lens with limits, a crew, a budget and a finite amount of time. A film required decisions to become physical before they could become visible. Even digital production preserved forms of resistance: specialist knowledge, rendering time, equipment, access, coordination and revision costs.

Resistance did not make the work good. Expensive productions have always produced empty images, and constraints have always been capable of becoming excuses. Scarcity is not a moral virtue. But resistance made indecision expensive. It forced some questions to arrive early: What are we trying to say? Which shot matters? What can be removed? What must remain consistent when the weather changes, the actor moves or the budget contracts?

The answers were never perfect. They did, however, leave consequences. A choice excluded other choices. A location altered the light. A lens changed the relationship between subject and world. A costume had to belong not merely to a mood board, but to a body, a scene and a sequence. Meaning accumulated through dependency.

Generative systems alter this economy. They do not abolish craft, cost or friction. They redistribute them. Some barriers fall sharply; others move downstream. The difficulty of producing a plausible frame may decrease while the difficulty of maintaining identity, spatial logic, narrative continuity, legal clarity and emotional coherence remains—or becomes more visible.

THE ABUNDANCE SHIFT

The first great promise of generative artificial intelligence was access. More people could test an idea before obtaining a budget, a crew or permission. A small studio could explore worlds that once required industrial infrastructure. A writer could

see a scene. A designer could compare directions. A filmmaker could prototype an impossible location before committing to production.

That promise is real. It should not be minimized to protect an older hierarchy of expertise.

But access changes the bottleneck. When plausible options become faster and cheaper to produce, the act of producing another option carries less information. Volume begins to imitate progress. Iteration becomes indistinguishable from avoidance. The contact sheet expands while the decision remains unborn.

This is where the language around AI often becomes confused. A large language model, or LLM, is a system trained on large amounts of text to predict and generate language. It can help interpret a brief, develop alternatives, structure information or articulate a direction. An image-generation model works differently: it produces images from learned statistical relationships between visual and linguistic patterns. In a contemporary workflow, these systems may be connected, but they are not the same machine and they do not perform the same creative function.

Neither system arrives with an intrinsic reason for the work to exist. It can propose. It can combine. It can surprise. It can expose the limits of the person using it. But intention is not hidden inside the interface, waiting to be unlocked by a more elaborate sentence.

The prompt has acquired a mythology partly because it is visible. It is the sentence typed before the result appears, so it looks like the place where authorship resides. But the visible instruction is only one layer of the process. The decisive work may have happened earlier, in the premise, the research and the exclusions; or later, in the diagnosis, correction, sequencing and release. A beautiful prompt can generate an irrelevant image. A plain instruction inside a rigorous system can produce a necessary one.

Tools generate possibilities. Direction chooses meaning.

BETTER WORK, NARROWER FIELD

The abundance argument needs precision. It is tempting to declare that AI makes everything average. That claim is dramatic, simple and false.

In one controlled experiment published in *Science Advances*, people who received ideas from generative AI wrote short stories that evaluators judged more creative, better written and more enjoyable—especially writers who scored lower on an independent measure of creativity. At the same time, the AI-assisted stories became more similar to one another. The result was not ‘AI destroys creativity.’ It was more interesting: individual performance can improve while collective diversity contracts.

The study concerned short written stories, not fashion films, brand systems or images. It cannot be used as universal proof of visual convergence. But it names a tension that creative teams should learn to recognize. An option may be better by familiar criteria and still make the field around it narrower. A polished answer can improve the object while quietly reducing the distance between objects.

A large meta-analysis of human–AI experiments offers another useful restraint. Human–AI combinations performed better than humans alone on average, but they did not outperform the better of the human or the AI alone on average. Results varied by task, with more promise in content creation than in decision tasks. Collaboration itself was not the magic. The design of the collaboration mattered.

This distinction is central to direction. The question is not whether AI is good or bad for creativity. The question is which decisions we are delegating, which capacities we are exercising, and what criteria remain active while speed increases.

If a system repeatedly offers the most legible version of ‘cinematic’, ‘premium’, ‘editorial’ or ‘authentic’, it may help a less experienced maker reach a persuasive baseline. But if that baseline becomes the destination, the work begins to inherit a con-

sensus it never chose. Not because the machine commands sameness, but because the human stops asking where the image should resist recognition.

THE NEW SCARCITY

When making becomes abundant, selection becomes expensive.

Not selection as preference—this one looks nicer, that one feels more premium—but selection as accountability. Why does the camera stand here? Why does this face belong to this world? Why is the light intimate if the performance is declarative? Why should the audience remember this color after the image disappears? What remains true when the image becomes a sequence, the sequence becomes a campaign and the campaign becomes a world?

Direction is the discipline that makes those answers depend on one another.

A prompt can contain references, lenses, fabrics, lighting conditions, gestures and moods. It can be technically sophisticated and visually productive. But a prompt is an instruction submitted to a system. Direction is the structure that decides which instructions belong, how outputs are judged, what must persist and when generation must stop. Prompting asks for an image. Direction establishes the conditions under which an image can be accepted.

This is why the trained eye does more than detect defects. It detects contradictions between successful elements. The weak frame is not always the one with the broken hand, impossible reflection or unstable face. Those errors are increasingly obvious and often repairable. The more dangerous frame may be technically clean and emotionally incoherent. It passes because every part looks expensive. It fails because no single intention governs the whole.

Coherence does not mean uniformity. A coherent work may contain rupture, ugliness, silence, excess or contradiction. The difference is that these tensions are authored. They have a function inside the work. Emotional collage occurs when codes

accumulate without hierarchy: intimacy, spectacle, nostalgia, sensuality, documentary truth, commercial polish. Direction decides which code leads and which ones must be refused.

Refusal, then, is not creative austerity. It is the mechanism by which a world acquires a boundary. Every persistent identity—of a character, a brand, a film or an institution—is composed as much by what it will not do as by what it repeats. Without refusal, consistency becomes cosmetic. With refusal, consistency becomes character.

The new scarcity is not imagery. It is judgment that remains stable under abundance. It is the ability to articulate a criterion before seeing the result, recognize the result that satisfies it, reject the attractive result that violates it, and preserve the decision across time. Judgment also has to survive seduction. Generative workflows reward the maker continuously: a new face, a new texture, a new camera move, another near-solution. The next output may always be better, and its possibility can prevent the current decision from becoming final. Direction creates an end condition. It defines what success would look like before novelty distorts the brief. Then it records why a frame passed, so that the next frame can be judged by more than resemblance or excitement.

This is where memory becomes a technical component of creativity. Without a decision ledger, teams repeatedly solve the same problem and call the repetition exploration. With one, taste becomes transferable. The system can remember that a certain kind of polish destroyed vulnerability, that a wider lens changed the character's authority, or that an elegant movement broke the stillness governing the world. Direction turns preference into an inspectable standard.

THE ABUNDANCE MAP

The shift can be described through four changing conditions.

First: execution. Plausible images, voices, texts and moving scenes can be produced by more people and at greater speed. Execution still requires knowledge, but the cost of testing a possibility has fallen.

Second: variation. A creative team can generate more options than it can meaningfully inspect. The operational advantage is real; so is the cognitive burden. More options do not create stronger criteria. They expose the absence of criteria.

Third: coherence. The more elements a system produces, the more relationships a director must govern. A single frame can hide inconsistency. A sequence reveals it. A campaign amplifies it. A persistent world makes it impossible to ignore.

Fourth: authorship. When execution becomes shared among humans and systems, authorship moves away from the mythology of the solitary hand. It becomes visible in the architecture of decisions: the premise chosen, the references interpreted, the alternatives refused, the corrections repeated and the final boundary drawn.

This map does not diminish making. It relocates its meaning. The craft is no longer demonstrated only by the difficulty of producing the object. It is demonstrated by the intelligence of the constraints that produced this object rather than a thousand adjacent ones.

The director's task is therefore not to compete with the machine's capacity for variation. That contest has no useful end. The task is to create a system in which variation can be judged. A system with memory. A system in which light, performance, texture, rhythm and narrative are not independent decorations, but participants in the same claim.

This is also why fluency with tools is necessary but insufficient. Interfaces will change. Model names will change. Prompt conventions will change. The enduring questions will not. What is this for? What must the audience feel before it understands? Which decision carries the identity of the work? What evidence would prove that the frame belongs? What are we willing to discard to protect the answer?

THE DECISIVE ACT

We have entered a period in which creation can begin before intention and continue long after judgment should have intervened. That is not a failure of technology. It is a crisis of direction.

The answer is not to make less because making has become easier. It is to make each acceptance mean more.

When everything can be made, making is no longer the decisive act.

Choosing is.

And every meaningful choice begins with a refusal.
